The GAIA-ESO Survey

Spectroscopic survey

- Stellar parameters
- Chemical abundances

Main components of the galaxy

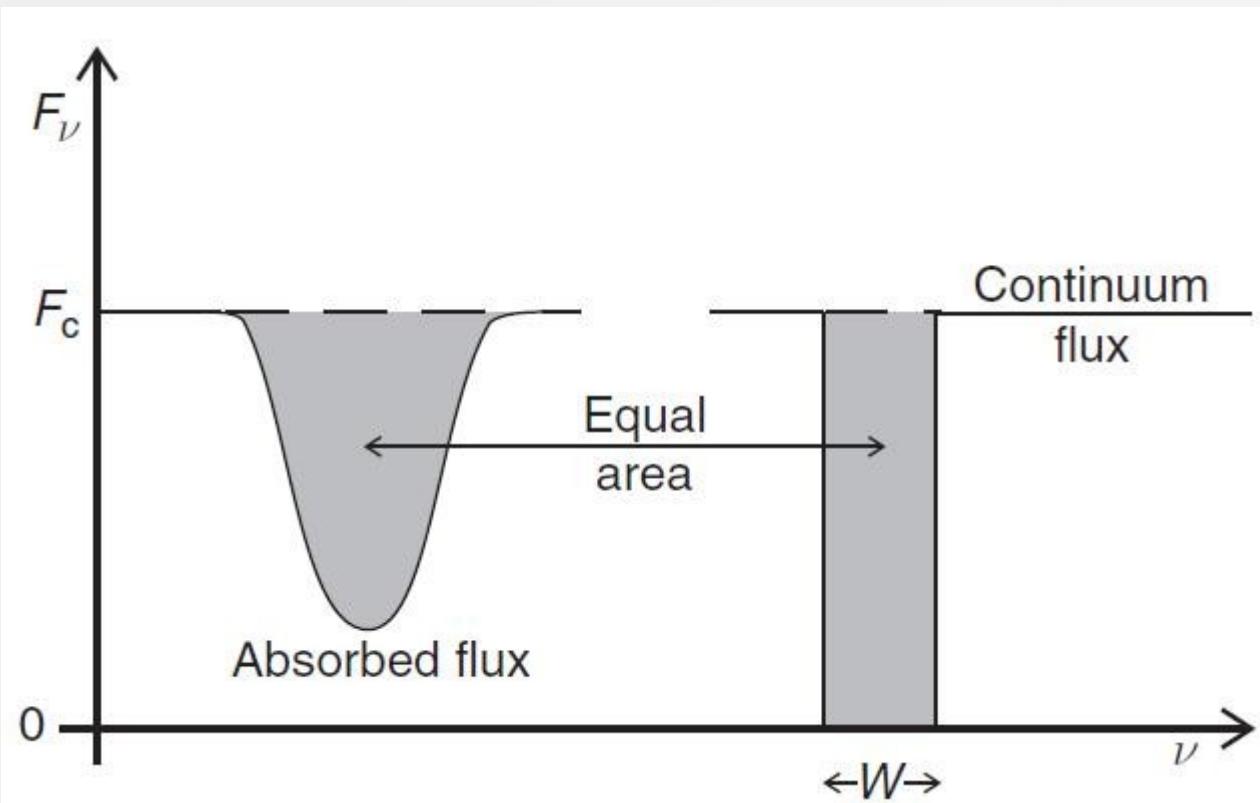

- Bulge, thick and thin disc, and halo
- Clusters

Observing with FLAMES:

- UVES ($R \sim 47\,000$): 5 000 stars
- GIRAFFE ($R \sim 20\,000$): 100 000 stars

Deriving the chemical abundances

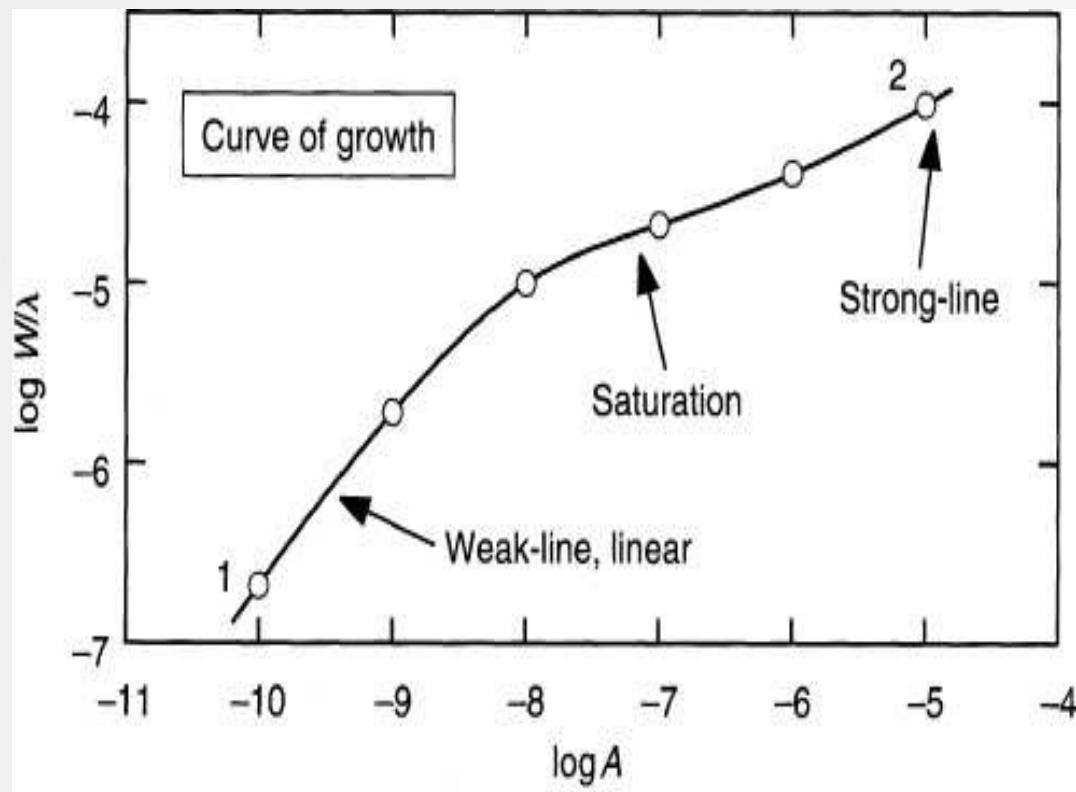

Equivalent width

Deriving the chemical abundances

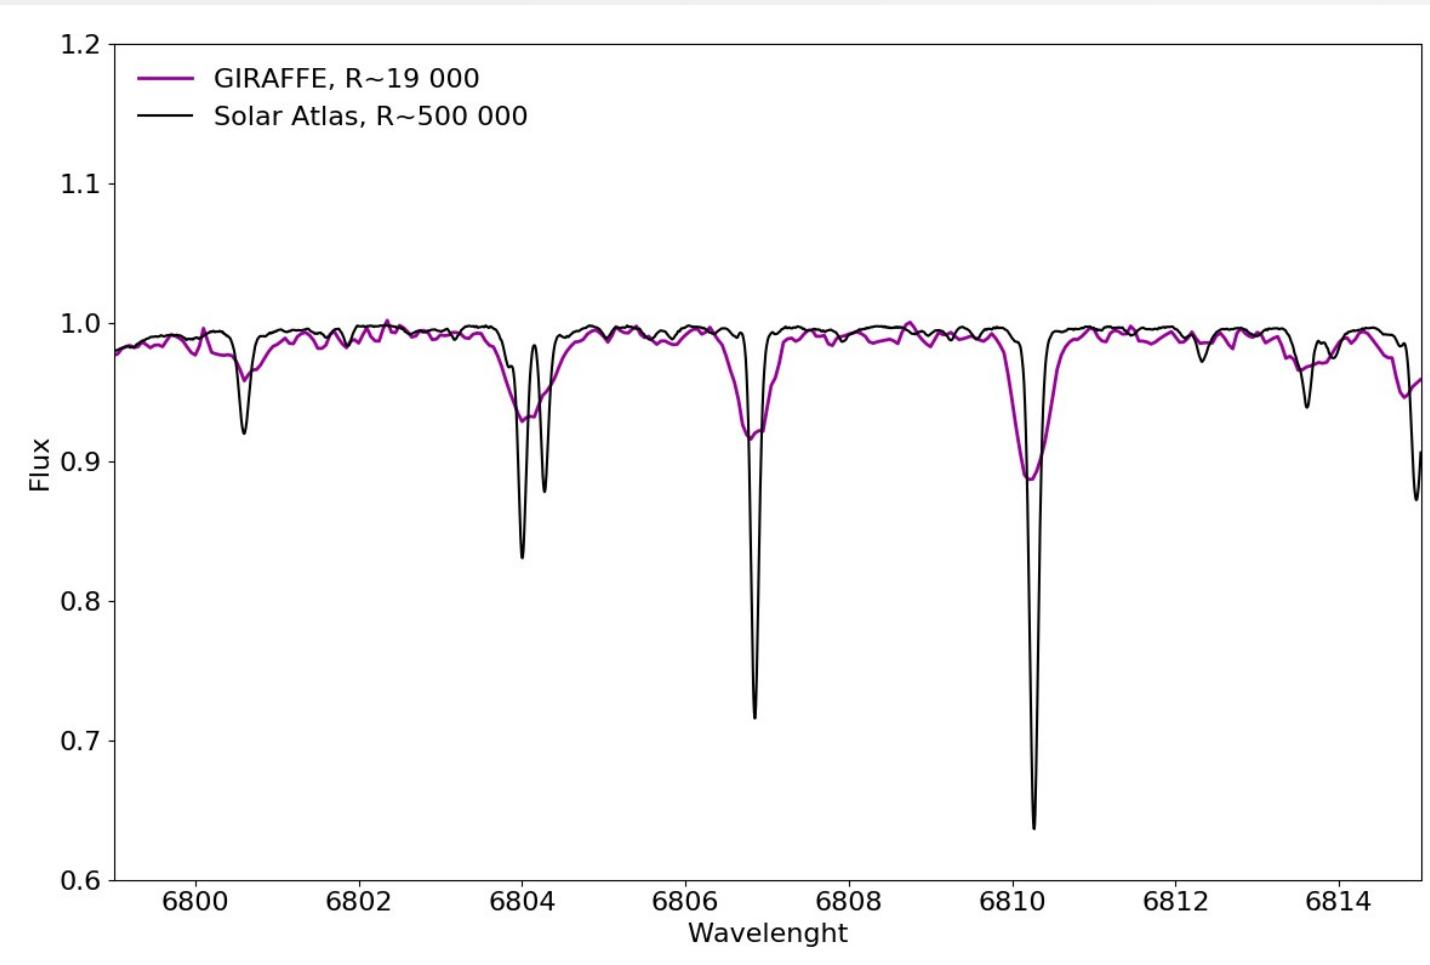

Curve of growth

The curve of growth is a mathematical relation between the EW and the chemical abundance

Deriving the chemical abundances

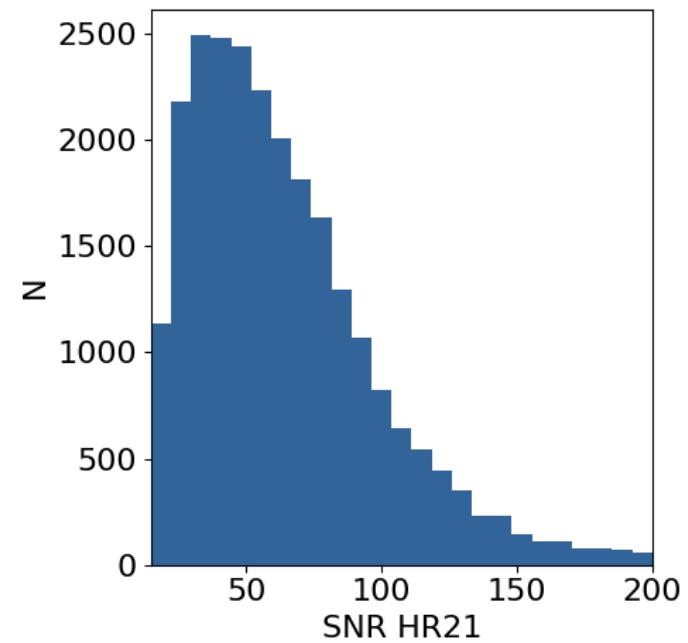

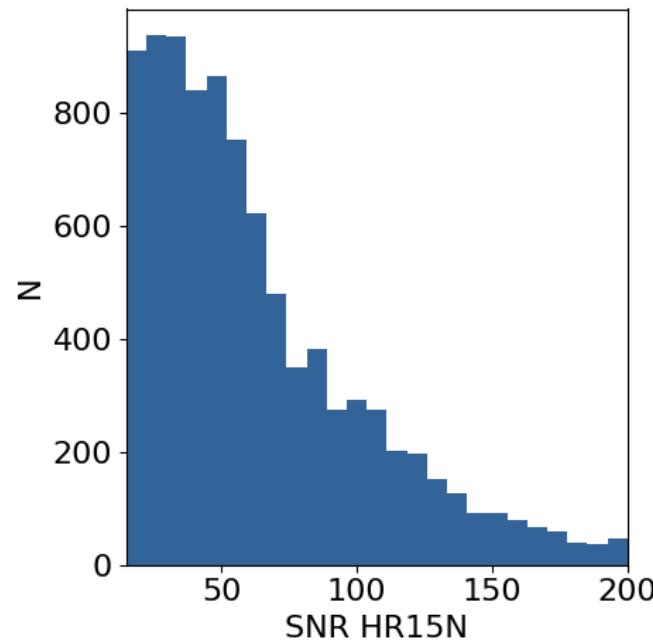

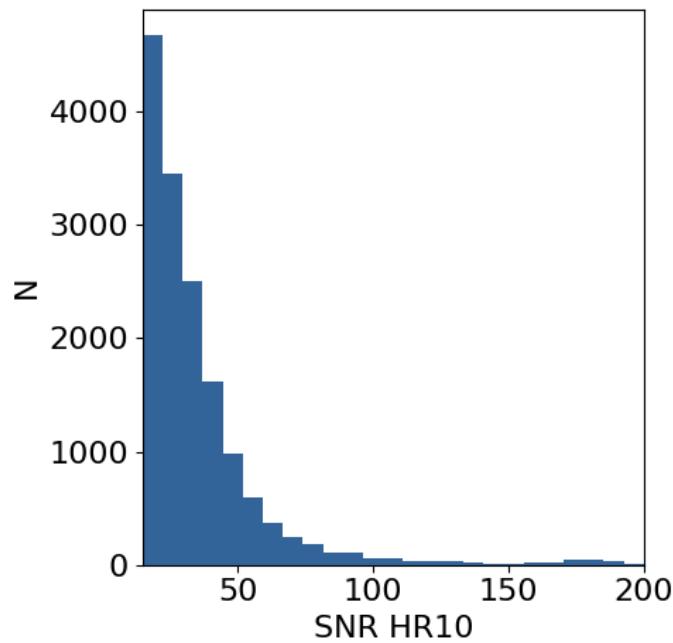

Medium resolution

Sun

Deriving the chemical abundances

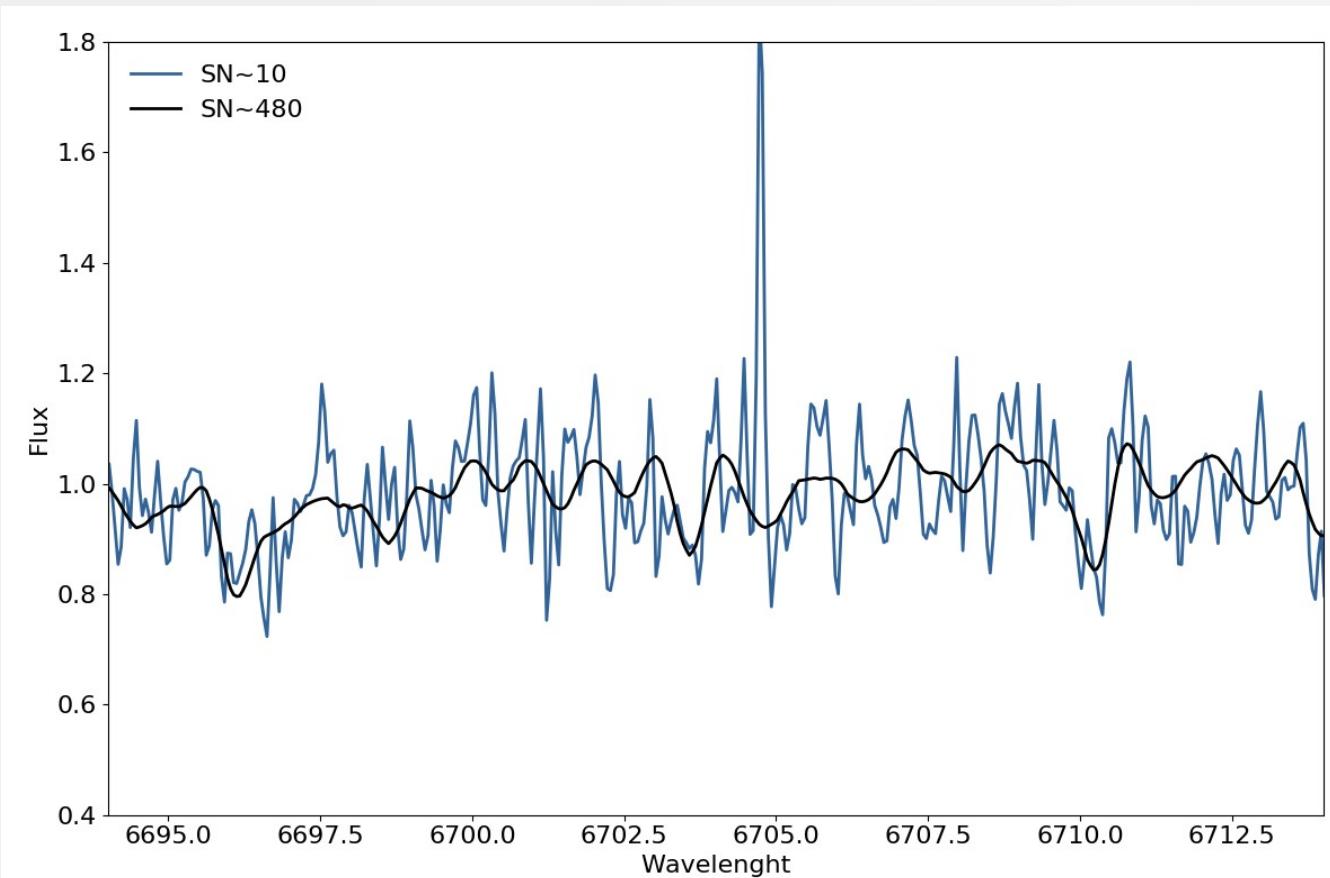

Low S/N in GES

Deriving the chemical abundances

Low S/N

alf Cet: GIRAFFE spectra R~19 000

Deriving the chemical abundances

Rigorous selection of spectral lines

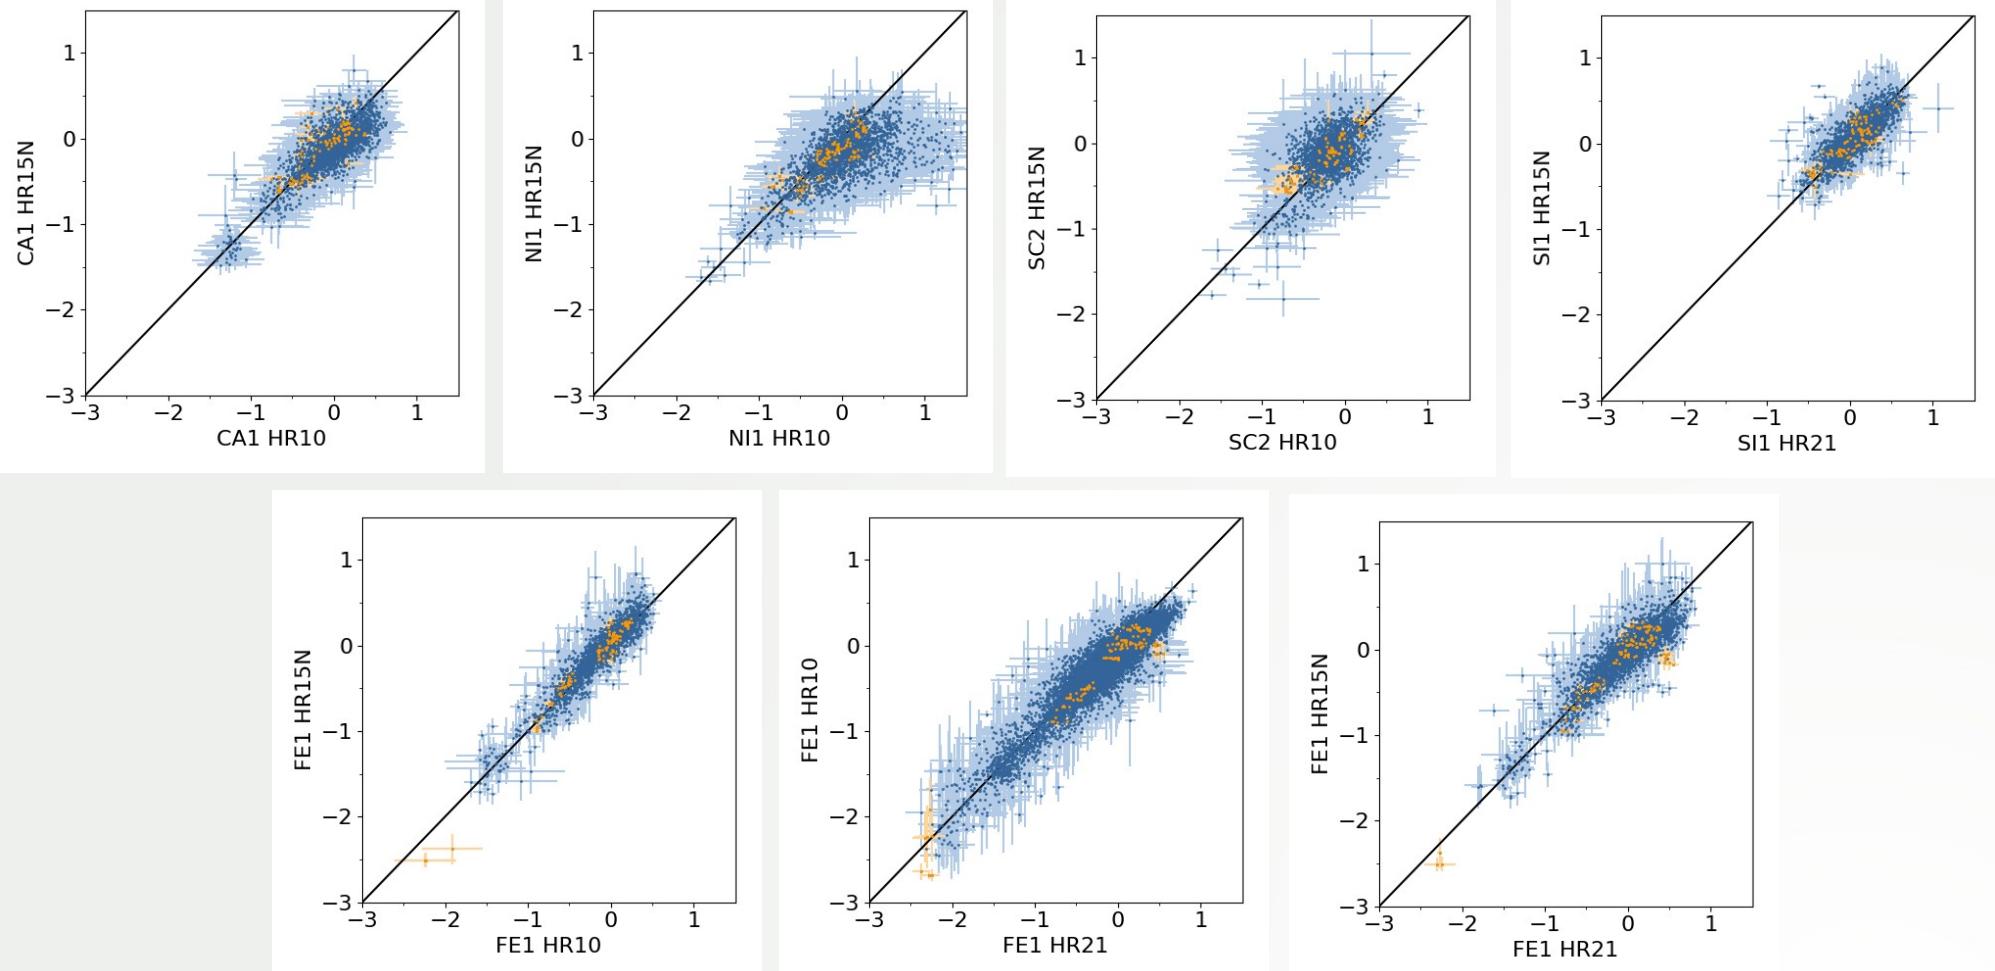

Normalization of the full spectra

ARES v2 (modified) + MOOG 2014 + MARCS model atmosphere

Abundances for setup:

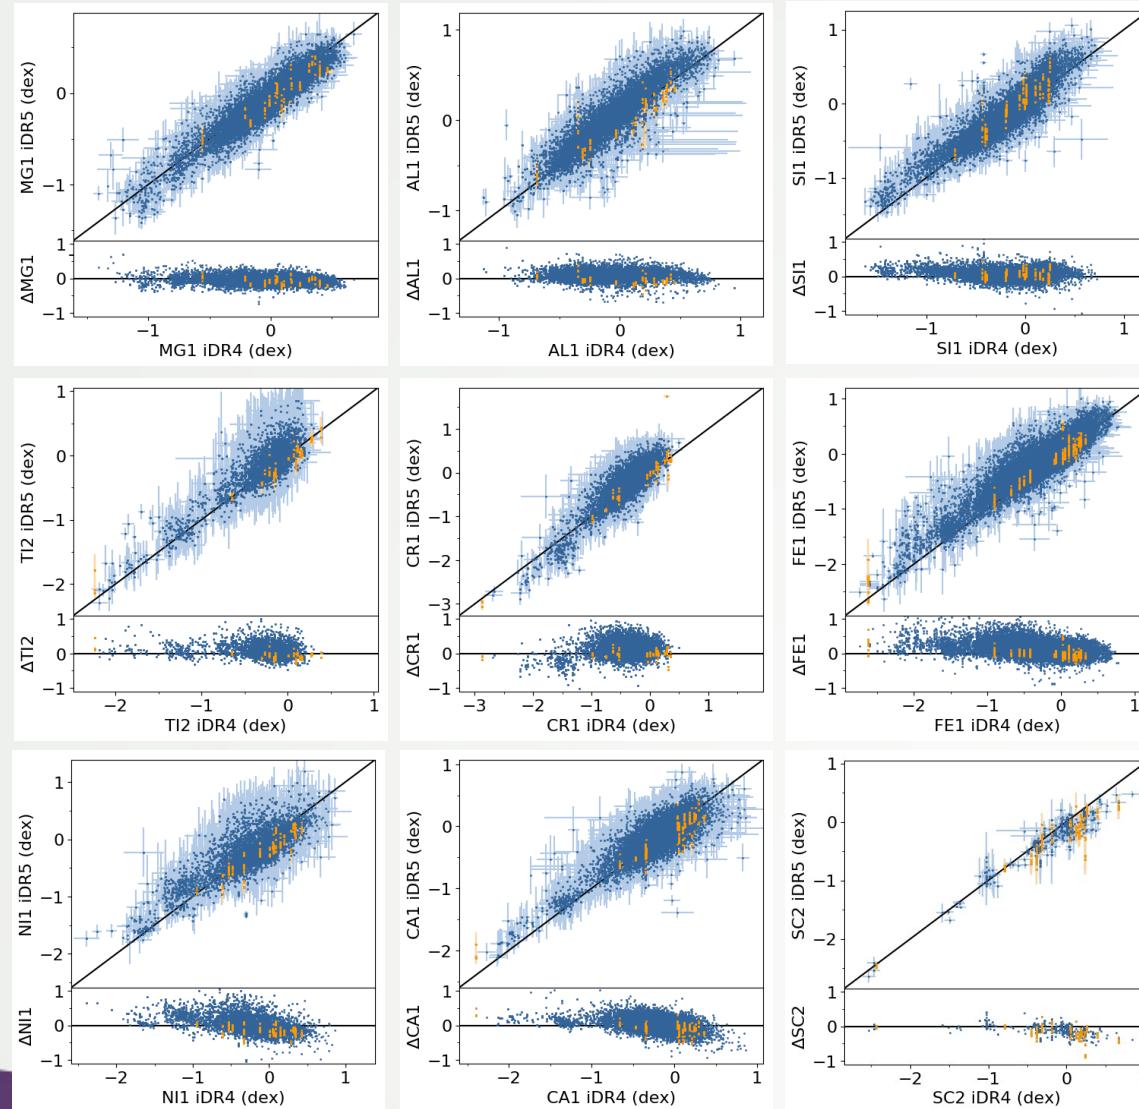

- HR10: CaI, ScII, CrI, FeI, and NiI
- HR15N: SiI, CaI, ScII, FeI, and NiI
- HR21: MgI, AlI, SiI, and FeI
- Total: 50 380 spectra analyzed

Comparing the setups

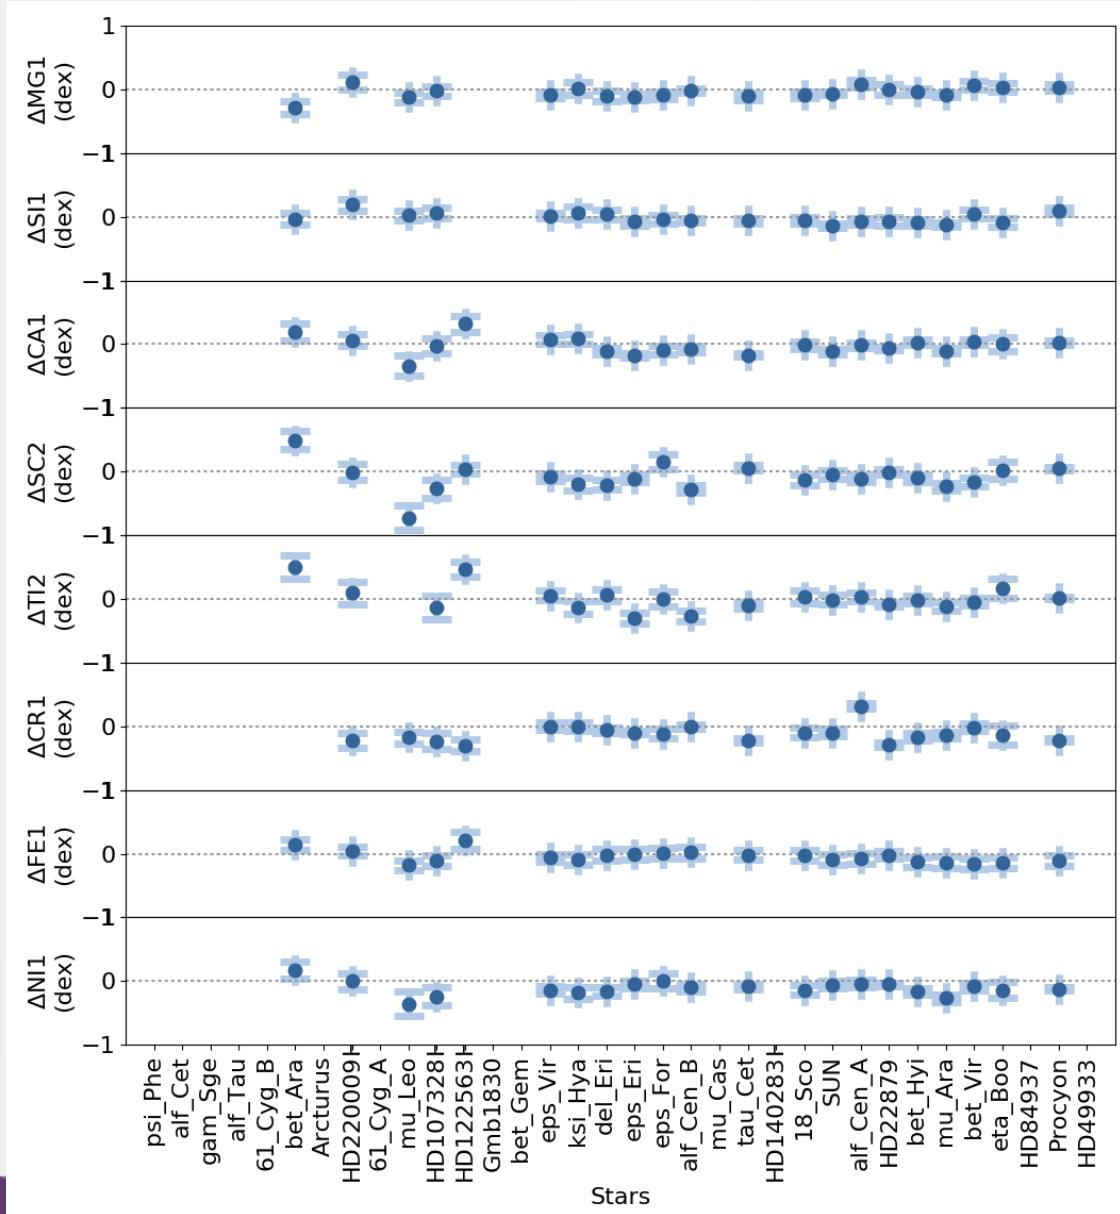

Comparing with previous results

GAIA-ESO Survey iDR4

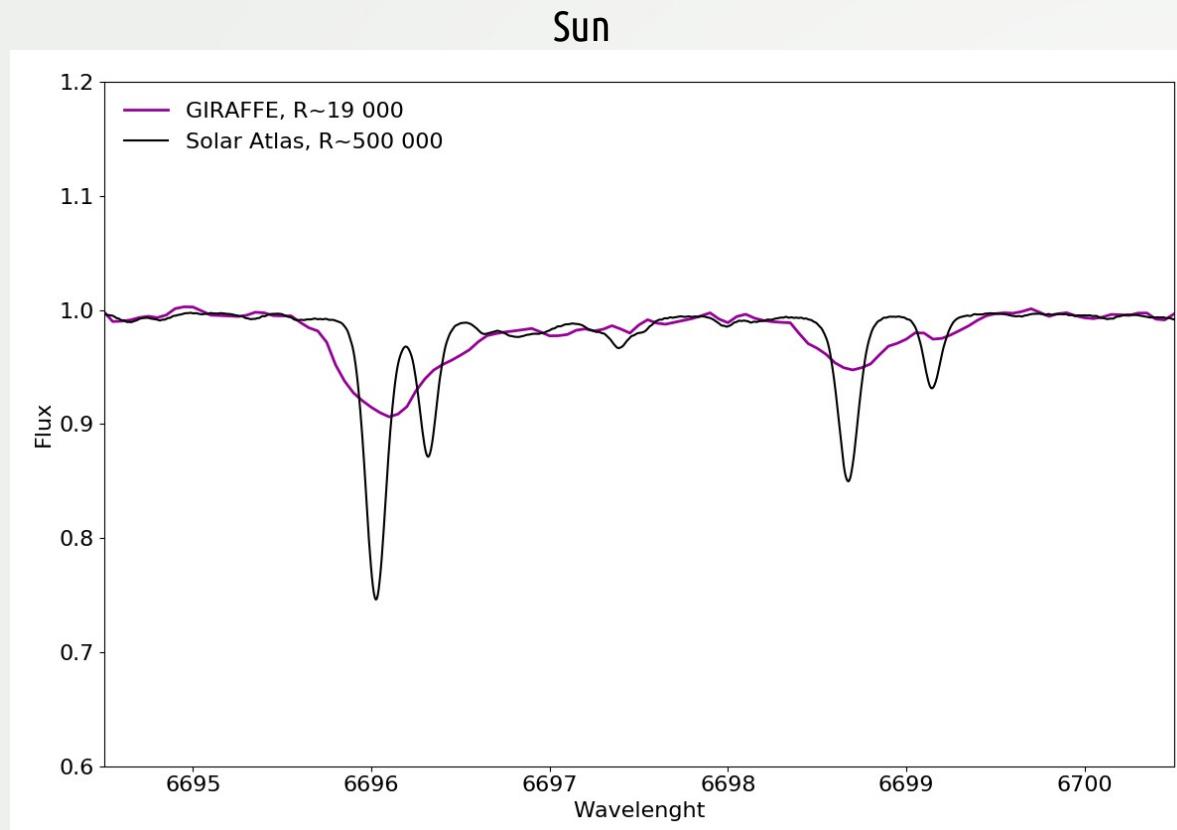

Comparing with the GAIA Benchmark

Jofré et al. 2014, 2015

Future work

- Improve the process of deriving chemical abundances in medium resolution spectra

Thank you!
